

Bitcoin and Cryptocurrency Technologies

Lecture 1: Economics and History

Yuri Zhykin

Feb 17, 2025

Economic concepts and properties of money

- **Money** is any item or verifiable record that is generally accepted as payment for goods and services
- **Durable** - able to retain its value over time
- **Portable** - easy to transport in sufficiently large quantities
- **Divisible** - can be divided into smaller quantities to represent whole range of value
- **Fungible** - two units of the same nominal value must be equally valuable
- **Scarce** - it must be very hard to increase the supply
- **Recognizable** - it must be easy to find peers willing to accept it as payment

Money before Bitcoin

- Seashells
- Silver
- Gold
- Paper money
- Fiat money

Centralized electronic money 1/2

- Traditional electronic money - centrally managed ledgers (bank databases)
- Transactions within a single bank - changes to the client's balance in the bank database
- Transactions between banks - communication between banks that aggregate payments between clients of different banks (e.g. SWIFT)

Centralized electronic money 2/2

- In most cases government is the central entity controlling monetary supply
- Assumption that government is competent enough to “manage” the economy
- Government can inflate fiat currency, effectively extracting resources from **all** its people without their consent
- Exclusive control over money is the ultimate tool of controlling people for totalitarian regimes

Decentralized electronic money

- Is it possible to eliminate central management?
- **Byzantine Generals Problem** - how can three generals agree on when to attack if they don't trust each other?
- **How can multiple parties come to a consensus without having to trust each other?**

Cypherpunk movement

- Widespread use of strong cryptography and privacy-enhancing technologies as a route to social and political change
- **Can we use strong cryptography to solve BGP and create a decentralized monetary system?**
- Several attempts:
 - David Chaum - DigiCash, 1989
 - Wei Dai - b-money, 1998
 - Nick Szabo - Bit Gold, 1998
 - Adam Back - Hashcash, 1997-2002

Satoshi Nakamoto and Bitcoin Genesis 1/3

- Financial crisis of 2007-2008
- On October 31, 2008, pseudonymous person **Satoshi Nakamoto** published a whitepaper titled "Bitcoin: A Peer-to-Peer Electronic Cash System"
- In late 2008 - early 2009, Nakamoto contacted Wei Dai, Adam Back and Hal Finney about the electronic cash system he was working on
- On January 3, 2009, Nakamoto released version 0.1 of the Bitcoin software and launched the network by mining the **genesis block**

Bitcoin Genesis Block

Satoshi Nakamoto and Bitcoin Genesis 3/3

- Satoshi Nakamoto continued Bitcoin development until mid-2010, when he transferred control over the repository to Gavin Andersen
- On April 26, 2011, Nakamoto wrote his last known email to Gavin Andersen, and never appeared online since
- The Bitcoin software written by Satoshi Nakamoto is the basis for the Bitcoin Core project
(<https://github.com/bitcoin/bitcoin>)

Bitcoin invention

- Cryptographic Proof of Work system solves the generalized Byzantine Generals Problem, eliminating the need to trust anyone on the network
- **Bitcoin is decentralized money**
- Transaction scripting system provides flexibility for more complex use cases than simple value transferring
- **Bitcoin is programmable money**

Market acceptance 1/2

- In 2010, the first known commercial transaction using bitcoin occurred when programmer Laszlo Hanyecz bought two Papa John's pizzas for 10,000 BTC
- In 2011, Bitcoin becomes accepted as donations by Electronic Frontier Foundation and WikiLeaks
- In 2011, price went from \$0.30 to \$5.27
- In 2012, from \$5.25 to \$13.30
- In 2013, from \$13.30 to \$770
- On March 11, 2024, bitcoin price is at ATH \$72080.69

Market acceptance 2/2
